

Images on the Internet.

1. how to filter away unsuitable images
2. how to find images and save them
3. how to resize the width and height of an image to reduce its file size
4. how to reduce the quality of an image to reduce its file size
5. how to list the source of an image when using it

1. how to filter away unsuitable images

Go to <http://google.com>.

In the window that opens click **Preferences**.

In the window that opens, scroll down and select **Use strict filtering (Filter both explicit text and explicit images)**.

Click the button **Save Preferences** and then **OK**.

2. how to find images and save them

Go to <http://google.com>.

In the window that opens click **Images**.

Type in a search text and press Enter, or Click **Advanced Image Search** for more search options.

As an example I typed **banchang** as my search text.

7,690 images were found and the first 20 were listed.

One of the images:

Banchang Central Shops &
Market - 14 ...

1600 x 1200 - 126k - jpg

picasaweb.google.com

1600 x 1200 means that the image is 1600 pixels wide and 1200 pixels high. My monitor has a width of 1024 pixels so it is wider than my screen. The file size, the amount of memory space it will take up if I save it, is 126KB.

My blog only accepts images 450 pixels wide and the file size should not be more than 50Kb for fast loading when someone visits my web page.

To save the image I click on it.

In the window that opens I notice the url of the page the image is on (http://picasaweb.google.com/td.in.thailand/Banchang#5083935634903342306), then I click **See full-size image**.

When the image is fully downloaded to the screen I right-click it and choose **Save Image as**. I save it in my network folder.

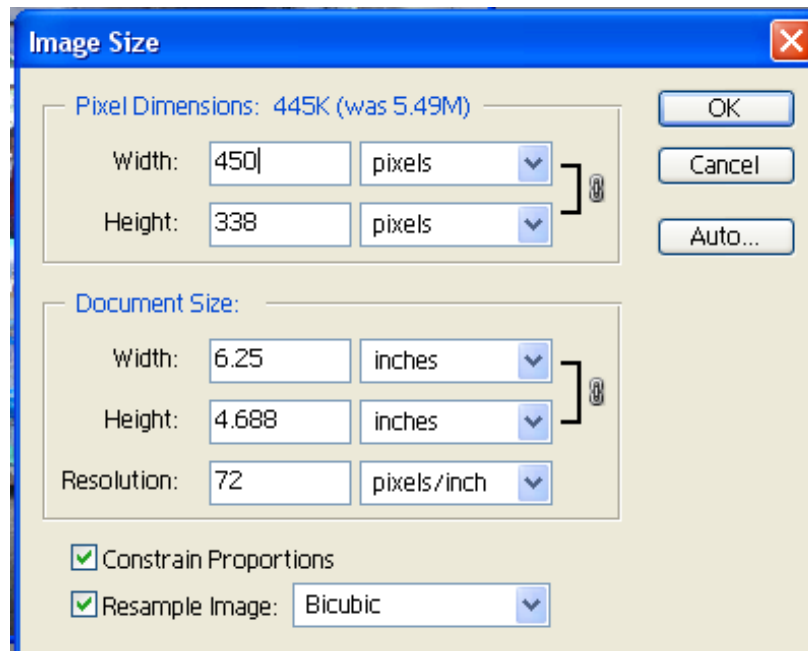

I notice that the image's file size is not 126Kb, but 406Kb.

3. how to resize the width and height of an image to reduce its file size

Open Adobe Photoshop (or any similar program you can download for free on the Internet).

Click Open on the File menu and select the file you just saved.

Click Image Size on the Image menu and change the width to 450 pixels. The height is automatically changed accordingly:

The image's file size dropped from 406Kb to 213Kb.

4. how to reduce the quality of an image to reduce its file size

To reduce the file size down to 50Kb I choose **Save For Web** on the **File** menu. In the window that opens I slide the **Quality slider** till I see in the lower left corner that the file size is about 51Kb. This reduction does not seem to reduce the quality of the image.

5. how to list the source of an image when using it

Below the image I give the url of the page the image was on:
